Aberthaw Power Station Boiler House & GT Stack Demolition

Today marked another important milestone in the transformation of the former Aberthaw Power Station, with a major explosive demolition event successfully completed on site.

Units 7 and 8 of the boiler house, together with the air heater bay and bunker bay, were successfully demolished as planned. This represents significant progress in the ongoing programme to safely clear the former power station site and prepare it for its next chapter.

Unit 9 remained standing following the demolition event. The specialist demolition contractors are currently investigating the cause and assessing the appropriate next steps. The structure remains within the controlled demolition area and established site safety arrangements remain in place.

The safety of our teams, contractors and the surrounding community remains our priority. We will provide a further update once the assessment has been completed and the next steps have been confirmed.

Overall, today's operation has delivered a substantial reduction in the remaining power station structures and represents another visible step forward in the transformation of Aberthaw.
